

WEB VAPT EVIDENCE FILE DOCUMENTATION

06-gobuster-directory-results(M).png

Field	Details
Project	Enterprise Security Assessment Lab
Module	Sub-Project 1 - Web Application VAPT
Evidence Row	07 - Gobuster additional output
Evidence File	06-gobuster-directory-results(M).png
Result Type	Enumeration evidence
Prepared For	GitHub portfolio documentation

Document Purpose

This PDF documents one specific evidence file from the Web VAPT evidence table. It embeds the actual screenshot, explains what the screenshot proves, maps it to the methodology, and records professional interpretation, risk, remediation, and redaction guidance for GitHub publication.

1. Embedded Evidence Screenshot

Figure 1 - Actual screenshot evidence: 06-gobuster-directory-results(M).png

What this screenshot proves

The screenshot shows a completed Gobuster run against a lab IP target with discovered paths including phpinfo and phpMyAdmin style endpoints.

2. Evidence Context

Area	Value
Testing Phase	Directory and File Enumeration - Additional Evidence
Tool / Component	Gobuster
Objective	Capture additional enumeration output against the lab IP-based target.
Result Type	Enumeration evidence

3. Command / Workflow Used

```
gobuster dir -u http://<LAB_IP> -w /usr/share/wordlists/dirbuster/directory-list-2.3-medium.txt -o gobuster_results.txt
```

The commands or workflow above represent the evidence-producing action. Placeholders such as , , or should be used in public documentation instead of live secrets or private infrastructure details.

4. Professional Interpretation

The screenshot shows a completed Gobuster run against a lab IP target with discovered paths including phpinfo and phpMyAdmin style endpoints.

This evidence should be treated as a supporting artifact, not as a standalone finding by itself. In a professional report, the screenshot supports a specific testing phase, validates an observation, and strengthens reproducibility when paired with methodology and remediation guidance.

5. Security Risk / Why It Matters

Discovery of phpinfo or phpMyAdmin-like paths can expose sensitive configuration data or administrative entry points in real deployments.

For this portfolio project, the risk is described in a real-world context while clearly noting that the target was an authorized DVWA/local lab environment. This avoids exaggerating lab results as production impact.

6. Recommended Remediation / Defensive Control

Remove phpinfo/debug pages, restrict database admin interfaces, and enforce network access controls.

7. GitHub Redaction Requirements

Lab IPs, private hostnames, discovered sensitive paths, and project-specific identifiers.

Before pushing to GitHub, confirm that screenshots do not expose cookies, session IDs, credentials, hashes, cracked passwords, private IPs, internal file paths, or any secret values. If the screenshot already contains sensitive information, blur or crop it before upload.

8. GitHub README Link Snippet

```

Legal and Ethical Note

This evidence documents authorized testing against an intentionally vulnerable local lab target. The techniques described must not be used against public or third-party systems without explicit permission.
