

WEB VAPT EVIDENCE FILE DOCUMENTATION

11-sqlmap-users-table-dump.png

Field	Details
Project	Enterprise Security Assessment Lab
Module	Sub-Project 1 - Web Application VAPT
Evidence Row	17 - SQLMap dump
Evidence File	11-sqlmap-users-table-dump.png
Result Type	Users table dump
Prepared For	GitHub portfolio documentation

Document Purpose

This PDF documents one specific evidence file from the Web VAPT evidence table. It embeds the actual screenshot, explains what the screenshot proves, maps it to the methodology, and records professional interpretation, risk, remediation, and redaction guidance for GitHub publication.

1. Embedded Evidence Screenshot

Figure 1 - Actual screenshot evidence: 11-sqlmap-users-table-dump.png

What this screenshot proves

The screenshot shows SQLMap dumping the users table. Sensitive hashes and values are visibly blurred, which is appropriate for publication.

2. Evidence Context

Area	Value
Testing Phase	Credential Exposure Impact Validation
Tool / Component	SQLMap
Objective	Demonstrate that the SQL Injection can lead to user-table extraction in the DVWA lab.
Result Type	Users table dump

3. Command / Workflow Used

```
sqlmap -u "<TARGET_URL>" --cookie=<REDACTED_COOKIE> -D dvwa -T users --dump --batch
```

The commands or workflow above represent the evidence-producing action. Placeholders such as , , or should be used in public documentation instead of live secrets or private infrastructure details.

4. Professional Interpretation

The screenshot shows SQLMap dumping the users table. Sensitive hashes and values are visibly blurred, which is appropriate for publication.

This evidence should be treated as a supporting artifact, not as a standalone finding by itself. In a professional report, the screenshot supports a specific testing phase, validates an observation, and strengthens reproducibility when paired with methodology and remediation guidance.

5. Security Risk / Why It Matters

In production, user-table dumps can expose credentials, profile data, and authentication material.

For this portfolio project, the risk is described in a real-world context while clearly noting that the target was an authorized DVWA/local lab environment. This avoids exaggerating lab results as production impact.

6. Recommended Remediation / Defensive Control

Fix SQLi, use strong password hashing, rotate exposed credentials, and implement database monitoring.

7. GitHub Redaction Requirements

Username, password hashes, plaintext/cracked passwords, full file paths, and cookie values.

Before pushing to GitHub, confirm that screenshots do not expose cookies, session IDs, credentials, hashes, cracked passwords, private IPs, internal file paths, or any secret values. If the screenshot already contains sensitive information, blur or crop it before upload.

8. GitHub README Link Snippet

```

Legal and Ethical Note

This evidence documents authorized testing against an intentionally vulnerable local lab target. The techniques described must not be used against public or third-party systems without explicit permission.
