

WEB VAPT EVIDENCE FILE DOCUMENTATION

Passive-Recon-p1.png

Field	Details
Project	Enterprise Security Assessment Lab
Module	Sub-Project 1 - Web Application VAPT
Evidence Row	27 - Passive Recon
Evidence File	Passive-Recon-p1.png
Result Type	Recon evidence
Prepared For	GitHub portfolio documentation

Document Purpose

This PDF documents one specific evidence file from the Web VAPT evidence table. It embeds the actual screenshot, explains what the screenshot proves, maps it to the methodology, and records professional interpretation, risk, remediation, and redaction guidance for GitHub publication.

1. Embedded Evidence Screenshot

Figure 1 - Actual screenshot evidence: Passive-Recon-p1.png

What this screenshot proves

The screenshot shows passive recon commands and WHOIS-style output used as methodology practice in the lab project.

2. Evidence Context

Area	Value
Testing Phase	Passive Reconnaissance
Tool / Component	whois, nslookup, dig, whatweb, wafw00f
Objective	Demonstrate passive-style reconnaissance commands and information collection approach.
Result Type	Recon evidence

3. Command / Workflow Used

```
whois TARGET
nslookup TARGET
dig TARGET ANY
whatweb http://TARGET
wafw00f http://TARGET
```

The commands or workflow above represent the evidence-producing action. Placeholders such as , , or should be used in public documentation instead of live secrets or private infrastructure details.

4. Professional Interpretation

The screenshot shows passive recon commands and WHOIS-style output used as methodology practice in the lab project.

This evidence should be treated as a supporting artifact, not as a standalone finding by itself. In a professional report, the screenshot supports a specific testing phase, validates an observation, and strengthens reproducibility when paired with methodology and remediation guidance.

5. Security Risk / Why It Matters

Passive recon can reveal ownership, DNS, infrastructure, and technology information before active testing begins.

For this portfolio project, the risk is described in a real-world context while clearly noting that the target was an authorized DVWA/local lab environment. This avoids exaggerating lab results as production impact.

6. Recommended Remediation / Defensive Control

Limit public information exposure and maintain accurate external asset inventories.

7. GitHub Redaction Requirements

Real domains, registrant details, emails, phone numbers, addresses, and IP addresses if not lab data.

Before pushing to GitHub, confirm that screenshots do not expose cookies, session IDs, credentials, hashes, cracked passwords, private IPs, internal file paths, or any secret values. If the screenshot already contains sensitive information, blur or crop it before upload.

8. GitHub README Link Snippet

Legal and Ethical Note

This evidence documents authorized testing against an intentionally vulnerable local lab target. The techniques described must not be used against public or third-party systems without explicit permission.
