

CLOUD SECURITY EVIDENCE REPORT

SCOUTSUITE OVERVIEW

Project	Enterprise Security Assessment Lab
Module	04 - Cloud Security
Evidence File	scoutsuite-html-report-overview.png
Report File	04-scoutsuite-overview-evidence-report.pdf
Result Type	AWS audit dashboard
Environment	AWS CloudGoat / AWS CLI / Pacu / ScoutSuite / Local Kali Lab
Publication Status	GitHub-ready portfolio report with sensitive values redacted

This document is an evidence-specific professional report. It explains one screenshot from the Cloud Security module, maps it to the testing methodology, interprets the tool output, and documents real-world risk, remediation and redaction requirements.

1. Embedded Evidence Screenshot

Figure 1 - Redacted evidence screenshot: scoutsuite-html-report-overview.png

What this screenshot proves

The dashboard view shows ScoutSuite summarizing AWS services, resources, rules, findings and checks. EC2 and CloudTrail/Config-related areas are visible as part of the audit overview.

2. Evidence Context

Testing Phase	Automated AWS Audit Overview
Tool / Component	ScoutSuite
Objective	Generate and review a ScoutSuite AWS report to identify service-level findings and prioritize cloud misconfiguration review.
Result Type	AWS audit dashboard

Evidence Source	scoutsuite-html-report-overview.png
-----------------	-------------------------------------

3. Command / Workflow Used

The following sanitized workflow represents the command pattern or console path used for this evidence. Live identifiers, account values, tokens and credentials are intentionally replaced with placeholders.

```
scout aws --profile <LAB_PROFILE>
# Open the generated HTML report in a browser
xdg-open scoutsuite-report/scoutsuite_results_aws-*.html
```

4. Sanitized Output Interpretation

The dashboard view shows ScoutSuite summarizing AWS services, resources, rules, findings and checks. EC2 and CloudTrail/Config-related areas are visible as part of the audit overview.

The goal of this evidence is not simply to show that a tool was executed. It demonstrates that the tool output was reviewed and interpreted as part of a controlled cloud security assessment. In a professional assessment, raw tool output must always be converted into a clear technical explanation, business risk statement and remediation plan.

5. Security Impact and Risk Analysis

Cloud audit dashboards help identify risky configuration patterns that may otherwise be missed during manual CLI testing. Findings may include weak logging, permissive security groups, encryption gaps, exposed resources or insecure defaults.

In a real cloud environment, the practical risk depends on the permissions of the identity, exposed services, network context, logging coverage and business sensitivity of the affected resources. This report treats the evidence as a lab finding but explains the likely real-world impact if the same condition existed in production.

MITRE / Control Mapping	T1538 - Cloud Service Dashboard / T1087 - Account Discovery
Impact Area	Identity security, cloud configuration, exposure management and operational governance
Portfolio Value	Shows tool execution, interpretation, redaction discipline and professional reporting maturity

6. Recommended Remediation

- Run automated cloud security audits regularly.
- Prioritize findings involving IAM, logging, public exposure and encryption.
- Create remediation tickets for high-risk services.
- Validate automated findings manually before final reporting.
- Use the audit as a recurring control, not a one-time check.

7. GitHub Redaction and Publication Guidance

The ScoutSuite dashboard may show AWS account ID and local report path. The account ID and path were redacted where visible.

Before committing any cloud evidence to GitHub, review the screenshot for AWS account IDs, ARNs, IAM usernames, bucket names, EC2 instance IDs, access keys, secret keys, session tokens, Azure subscription identifiers, public IP addresses, billing details and local private paths. If any of those values are present, redact or blur them before upload.
