

CLOUD SECURITY EVIDENCE REPORT

AWS FREE TIER / BILLING CHECK

Project	Enterprise Security Assessment Lab
Module	04 - Cloud Security
Evidence File	14-aws-free-tier-cleanup-check.png
Report File	08-aws-free-tier-billing-check-evidence-report.pdf
Result Type	Cost and cleanup verification
Environment	AWS CloudGoat / AWS CLI / Pacu / ScoutSuite / Local Kali Lab
Publication Status	GitHub-ready portfolio report with sensitive values redacted

This document is an evidence-specific professional report. It explains one screenshot from the Cloud Security module, maps it to the testing methodology, interprets the tool output, and documents real-world risk, remediation and redaction requirements.

1. Embedded Evidence Screenshot

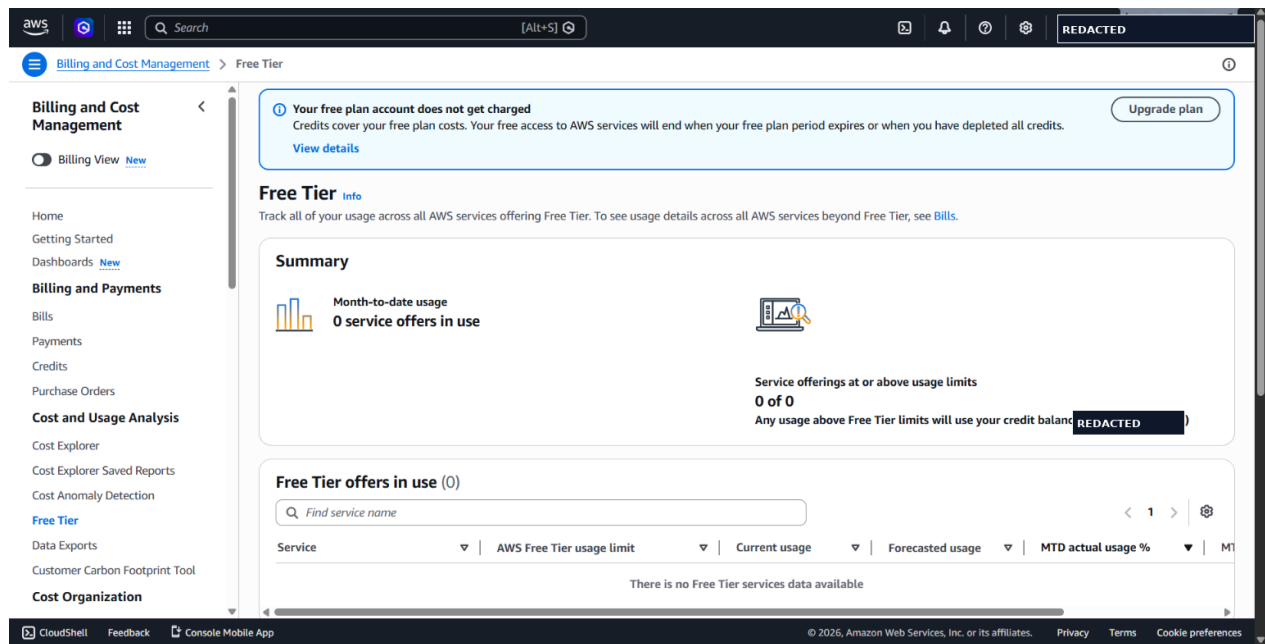

Figure 1 - Redacted evidence screenshot: 14-aws-free-tier-cleanup-check.png

What this screenshot proves

The screenshot shows the AWS Free Tier page with zero service offers in use and cost/usage summary context. This supports responsible resource lifecycle and billing review after lab activity.

2. Evidence Context

Testing Phase	Billing and Free Tier Verification
Tool / Component	AWS Billing and Cost Management Console
Objective	Confirm that AWS Free Tier usage and cost indicators were reviewed after lab cleanup.
Result Type	Cost and cleanup verification
Evidence Source	14-aws-free-tier-cleanup-check.png

3. Command / Workflow Used

The following sanitized workflow represents the command pattern or console path used for this evidence. Live identifiers, account values, tokens and credentials are intentionally replaced with

placeholders.

```
# Console workflow
AWS Console -> Billing and Cost Management -> Free Tier
# CLI support where available
aws ce get-cost-and-usage --time-period Start=<YYYY-MM-DD>,End=<YYYY-MM-DD> --granularity MONTHLY
--metrics UnblendedCost
```

4. Sanitized Output Interpretation

The screenshot shows the AWS Free Tier page with zero service offers in use and cost/usage summary context. This supports responsible resource lifecycle and billing review after lab activity.

The goal of this evidence is not simply to show that a tool was executed. It demonstrates that the tool output was reviewed and interpreted as part of a controlled cloud security assessment. In a professional assessment, raw tool output must always be converted into a clear technical explanation, business risk statement and remediation plan.

5. Security Impact and Risk Analysis

Cloud security labs can accidentally generate cost through running instances, NAT gateways, storage, logs or misconfigured services. Billing checks reduce operational risk.

In a real cloud environment, the practical risk depends on the permissions of the identity, exposed services, network context, logging coverage and business sensitivity of the affected resources. This report treats the evidence as a lab finding but explains the likely real-world impact if the same condition existed in production.

MITRE / Control Mapping	Operational control - cost monitoring and cloud resource governance
Impact Area	Identity security, cloud configuration, exposure management and operational governance
Portfolio Value	Shows tool execution, interpretation, redaction discipline and professional reporting maturity

6. Recommended Remediation

- Set budgets and alerts before running labs.
- Check Cost Explorer after every cloud exercise.
- Delete unused EC2, EBS, S3, IAM and CloudFormation resources.
- Avoid leaving public resources running.

- Document cleanup as part of the security project.

7. GitHub Redaction and Publication Guidance

Account name and credit/billing details were redacted. Billing pages should not be uploaded without reviewing for account identifiers and financial information.

Before committing any cloud evidence to GitHub, review the screenshot for AWS account IDs, ARNs, IAM usernames, bucket names, EC2 instance IDs, access keys, secret keys, session tokens, Azure subscription identifiers, public IP addresses, billing details and local private paths. If any of those values are present, redact or blur them before upload.
